

RESTORATIVE Cleaning Instructions - Hot water extraction

RESTORATIVE (CORRECTIVE) CLEANING

1. SPRAY Crystal Extract® solution lightly onto carpet.
 - Mix according to instructions on container
2. AGITATE with LOMAC® Machine immediately.
 - No dwell time is necessary
 - If you are using the LOMAC® Electric Applicator, pre-spray and agitation are performed in one forward pass.
 - Operate machine in North/South and East/West direction for moderately to heavily soiled areas.

Productivity - 1,500 to 3,000 sq. ft. per hour

3. HOT WATER EXTRACT with only water in the tank of the extractor.
 - Important note: If heavy soil is visible, the cleaning frequency may not be adequate and needs re-evaluated.
 - Occasionally, spots may reappear a day or two after extraction is performed. Refer to Daily Spot Cleaning Instructions for removal.
 - Drying time should be less than 12 hours (4-6 hours is preferable)
 - Make several dry (vacuum only) passes with extractor wand to remove the maximum amount of moisture.

Productivity - 500 to 900 sq. ft. per hour

Operate HVAC until completely dry

- If a typical room's carpet is left wet overnight with no HVAC to circulate air and remove moisture, mold growth could potentially begin in causing rapid spreading in the morning when it is turned on.
- Utilize portable air-movers, if possible, as needed.
- Keep in mind that these are expensive to operate for long periods of time.
